

# RECRUITMENT TASK

There are employee's personal data in data.json file. The task is to:

- present them in a table and to implement filtering according to each attribute (it is recommended to use any datepicker for attribute data type),
- do sorting and pagination (5 results for one page),

It is allowed to use any library, but every functionality (filtering, sorting, pagination) should be implemented independently.

Please, share your solution as a repository on Github.

Good luck!
